

Dear Hiring Team,

I am applying for the Sviluppatore Senior PHP/Laravel (AI-Augmented) role at Cuborio. I bring more than 15 years of backend experience across PHP and Go, including Laravel delivery, production reliability, API work, and technical leadership. Your focus on senior validation of AI-assisted changes aligns with the judgement I have developed in operational backend systems.

At airSlate, I worked on PHP/Laravel backend services, investigated API and database bottlenecks, and helped move services to Kubernetes with repeatable CI/CD workflows. This required evaluating a change's performance, operational, and maintainability consequences—an approach I would bring to reviewing and refining generated code within Cuborio's Laravel platform.

At Simple.life, I designed a support-automation platform connecting Zendesk, Intercom, and internal services. I integrated AI-powered triage that automated or deflected up to 30% of inbound tickets, and built delivery paths with fallback logic, retries, and monitoring. This gave me practical experience of where AI can accelerate delivery and where careful engineering review remains essential.

Cuborio's customised e-commerce platform and quality-focused AI workflow are compelling because they prioritise secure, maintainable production outcomes. My earlier financial-system integrations and high-volume transactional communications also provide useful context for dependable customer-facing flows.

I would welcome a discussion about how my PHP/Laravel background and AI-automation experience could support your projects, and can confirm availability for the collaboration model and meetings.

Valentin Nikolaev
